Program - 2

Computation of Descriptive statistical measures

Date : 07.08.2026

Aim

Write a Python program to compute descriptive statistical measures like mean, median, standard deviation, and summary statistics for a given dataset.

Algorithm

1. Start.
2. Import the Pandas library.
3. Create a dataset containing students' marks.
4. Convert the dataset into a Pandas DataFrame.
5. Display the dataset.
6. Calculate the mean of the marks.
7. Calculate the median of the marks.
8. Calculate the standard deviation of the marks.
9. Find the minimum mark.
10. Find the maximum mark.
11. Display the summary statistics using describe().
12. Stop.

Progam - 2

```
import pandas as pd
data = {
      'Marks': [65, 72, 85, 90, 78, 88, 95, 70, 82, 91]
}
df = pd.DataFrame(data)
print("Dataset:")
print(df)

mean = df['Marks'].mean()
print("\nMean:")
print(mean)

median = df['Marks'].median()
print("\nMedian:")
print(median)

std_dev = df['Marks'].std()
print("\nStandard Deviation:")
print(std_dev)

minimum = df['Marks'].min()
maximum = df['Marks'].max()

print("\nMinimum:", minimum)
print("Maximum:", maximum)
print("\nSummary Statistics:")
print(df['Marks'].describe())
```
